Making Choices

The Attorney General's Office presents the following information on staffing in nursing homes to assist the public in making difficult and personal decisions in choosing a long term care facility.

Approximately a quarter million New Yorkers receive care in nursing homes every year. For many near the end of their lives, a nursing home may be their last home. For those choosing a nursing home, a major concern is that the facility provide good and safe care. While there is no substitute for personal visits and close monitoring of the care that a resident is actually receiving, there are certain criteria to be aware of when choosing a home. One of those criteria is a home's staffing level.

Numerous studies have shown a strong relationship between the hours of care a resident receives and the quality of care a resident receives. If there are too few professionals caring for residents, then resident health can be dramatically impaired. A comprehensive federal study has quantified these staffing levels to certain thresholds below which the quality of care suffers. As the literature shows, experts differ on exactly where the line should be drawn from a public policy point of view. A number of states have drawn lines by adopting minimum staffing levels for nursing homes. But only you can decide where the line should be drawn for you or your family members.

-

¹ To provide information to consumers about the possible effects of low staffing, Appendix B describes the comprehensive federal study and other research.

To aid those choosing nursing homes, we have attached a list of staffing levels in New York nursing homes.² The staffing levels in the list were reported by the homes themselves. Each nursing home must undergo periodic inspections by Department of Health surveyors. In connection with those inspections, the home must report its staffing levels for a two-week period. The data in the list was reported in connection with inspections conducted from August 2004 to November 2005.

In the list that follows, you will see New York nursing homes listed alphabetically, with their staffing levels for various categories of direct nursing care. We applied the standards of five states and the federal study, and placed a check mark ($\sqrt{}$) in the appropriate column when the home meets that standard.³ A blank box in a column means that the staffing levels at the home in question do not meet that standard.

According to these figures, about 98% of New York's nursing homes fall in the range at which, in the comprehensive federal study, quality of care for long-stay residents was shown to suffer. Staffing levels in about 70% of our homes do not meet the standards set in Florida; about 38% do not meet the standard in California; about 26% do not meet the Vermont standards; about 25% do not meet Ohio's standard for Registered Nurses; and about 3% do not meet the standards in Illinois.

-

² The staffing figures were not available for several nursing homes, which are listed in Appendix A.

³ In any gray areas (as explained in the explanatory notes preceding the list), we made assumptions in favor of the facilities.

The consequences of understaffing can sometimes be tragic. The Attorney General's Office has prosecuted nursing home owners for failing to provide legally required care. In 2001 we launched a Nursing Home Initiative. Some of the cases resulting from that project are described in Appendix C. Although only a small number of nursing homes deserve criminal sanctions, these are critical efforts and they must and will continue.

Finally, by issuing this report, we are not suggesting that levels of staffing, alone, guarantee quality care. Much goes into quality care beyond numbers. Staff motivation and competence is vitally important. And as we describe below, the significance of a home's staffing levels may be affected by the needs of its resident population; a home with sicker residents may need more staff. In assessing a nursing home, it is important to consider a full range of information: You should visit the home and look around. You should learn about the management and staff, including the level of turnover. You should speak with caregivers. You should speak with others who have experience with nursing homes in your area, including knowledgeable professionals.

What the Numbers Mean

To make sense of these numbers, it is important to understand the kinds of professionals who deliver care in nursing homes, and the different staffing levels evaluated in studies or required by states.

Categories of nursing caregivers

Nursing care is provided by two kinds of licensed nurses, and also by nurse aides. In New York, the two kinds of licensed nurses are Registered Nurses (RNs) and Licensed Practical Nurses (LPNs), and the aides are called Certified Nurse Assistants (CNAs).

Staffing levels for each group are important, because caregivers in different categories provide different kinds of care. Only RNs can assess patients and perform certain specialized procedures. Only licensed nurses (LPNs and RNs) can dispense medications, provide treatments, and supervise the delivery of care. The CNAs are responsible for crucial but time-consuming services such as feeding, bathing, dressing, toileting, and transporting the residents. Each of these functions is vital.

Because each category of nursing staff has its own responsibilities, a shortage of staff in any category may impede the home's ability to deliver care. Thus, some states' standards include minimum levels not only for overall nursing hours, but also for staffing levels in specific categories.

Minimum standards for nurse staffing

The charts and lists in this report apply standards set by some of the states, and also those identified by a comprehensive study commissioned by the federal Centers for Medicare and Medicaid Services (CMS) at the direction of Congress. Some of the state standards were adopted in the wake of a series of studies (described in Appendix B) of the significance of nursing care staffing levels.

Those studies, and the state standards, frequently measure care in terms of the average number of hours of daily care that staff members provide to each resident of the home ("hours per resident day" or "hprd"). This measure is calculated by adding up the total number of hours worked by the nursing staff and dividing it by the number of resident-days during the reporting period.

The CMS study identified three staffing thresholds below which the quality of care was found to suffer: a threshold of 0.75 hours per resident day (45 minutes) for RNs; a threshold of 1.3 hprd (1 hour, 18 minutes) for total licensed nursing services (RNs plus LPNs); and a threshold of 2.8 hprd (2 hours, 48 minutes) for CNAs. Any nursing home that meets these standards would provide at least 4.1 hprd (4 hours, 6 minutes) of total nursing care.⁴

Many states have set staffing requirements, and in this report we focus on several of them.⁵ In 2001, Florida enacted a statute to phase in staffing ratios; it now requires averages of 1 hprd of licensed nurse care plus 2.6 hprd of nurse aide

⁴ The Department of Health and Human Services concluded that the study was "insufficient for determining the appropriateness of staffing ratios in a number of respects"; its objections are summarized on page 13 below. However, that department has used the study to measure the adequacy of nursing home staffing in specific instances. *See* Office of Inspector General, "Adequacy of Medicaid Payments to Albany County Nursing Home" (June 2004).

care. California set a minimum staffing level and then twice increased it. The current California standard, which became effective in 2000, requires an average of 3.2 hprd of total nursing care per resident. Starting in 2001, Vermont required nursing homes to provide an average of 2 hprd of nurse aide care as part of an average 3 hprd of overall nursing care. Also starting in 2001, Ohio required average total care of at least 2.75 hprd, including .2 hprd of RN care and 2 hprd of nurse aide care. Several states, including Illinois, require 2.5 hprd of average total nursing care, and various other states have minimum staffing standards as well.⁶

In the following pie charts, we compare staffing levels in New York nursing homes to some of the standards set by those states or identified by the CMS study,⁷ and how many New York homes meet these standards.8

⁵ More detailed information about these state standards is found in the explanatory notes preceding the list of staffing levels.

⁶ For example, Delaware adopted a schedule requiring 3 hours of daily care starting in 2001, 3.28 hours starting in 2002, and 3.67 hours starting in 2003 subject to further review and the availability of funds. 16 Del. C. §1162(b), (c), (e). One of the highest standards, adopted by Maine in 2001, is written in different terms from those discussed above. The Maine standard requires one direct care provider for every 5, 10, and 15 residents on the day, evening, and night shifts, respectively. 10-144 CMR ch. 110 sec. 9.A.4. These levels generally require higher staffing than the various state standards written in terms of hours per resident day.

⁷ A nursing home is counted as meeting a standard only if it meets all the components of that standard that are measured in this report (e.g., both licensed hours and total hours). The procedures we followed to assess compliance with the components, and the reasons we did not assess compliance with some of the components, are discussed in the explanatory notes preceding the list.

⁸ Our figures may err on the side of the nursing homes. First, our figures are drawn from a set of staffing data (the "OSCAR data") that is reported by the homes themselves, as described on page 8. For some homes, the OSCAR data may overstate actual staffing levels, and states typically do not use this same OSCAR data in measuring compliance with their standards, but obtain necessary data in other ways. Second, in any gray areas involving application of a standard, we gave the benefit of the doubt to the homes. See "Explanatory Notes" at page 15 below.

How New York homes fare under various standards

Source of the data in the list

All the staffing data in the following list was reported by the homes themselves. New York State periodically inspects nursing homes. In connection with each inspection, the facility is required to report certain information, including its staffing levels for a two-week period. This information is collected in a database called Online Survey, Certification, and Reporting (OSCAR), and it is the basis for the Nursing Home Compare website maintained by CMS (http://www.medicare.gov/NHCompare).

The following list includes OSCAR data showing the staffing hours reported by New York nursing homes. It includes the homes' reported levels for various categories of nursing caregivers (RNs, total licensed nurses, and CNAs), and also total nursing staff hours, both with and without time spent on administrative functions. The staffing data in the following list was provided to us by CMS in December 2005.

The list also shows which homes would meet or exceed standards set by certain other states. While the data contained in this report can be useful in choosing a nursing home, it should not be the sole information on which consumers rely. There may be factors limiting the value of this data for comparing the quality of homes, such as differences in resident populations and medical acuity, which are discussed below. Consumers should therefore seek additional information, talk with professionals and others who have had experience with

⁹ Not every New York nursing home is included, because CMS excludes data that falls outside certain ranges. The CMS criteria for excluding that data, and a list of the nursing homes excluded from the staffing lists on that basis, are set forth in Appendix A.

potential homes, and conduct site visits of those homes in order to make such a choice. And we need not be complacent about the quality of the available data. Nursing homes, government, academic researchers, consumer advocates and other stakeholders must also work together to improve and standardize data about other indicators of nursing home performance so that consumers can have the best information possible in making such a critical health care decision.

Levels of medical need

Different nursing homes have different kinds of resident populations. Some have particularly sick residents who need more care, and others have relatively healthier residents who need less care. Some of the highest-staffed homes in the state serve residents with specialized needs (like patients on ventilators) who may require more staff. Consumers should be aware of these varying levels of medical needs when comparing staffing levels. Seemingly high staffing levels may not be unusually high for a resident population of high average medical acuity or special needs, just as seemingly low staffing levels may not be truly low for a resident population of low average medical acuity and few special needs.

To help consumers assess the staffing levels in the following list, the list also includes two kinds of information about medical need levels in the various nursing homes: the nursing home's Case Mix Index ("CMI") and the extent to which it cares for "special needs" patients. Although the staffing levels in the list are taken from the OSCAR data, these two indicators of medical needs are taken from other sources. The CMI is a numerical measure of the average medical acuity of its residents, computed by the Department of Health based on "patient review instruments" provided by each facility. CMIs can range from .55 to 1.79. A

higher number means that the patient population is sicker. We have provided CMI data from the most recent quarter available to us for each home. For 2003, the average CMI for New York's nursing homes was 1.17.

Similarly, as to "special needs," the six categories of special-needs residents are pediatric, traumatic brain injury, AIDS, ventilator, respite care, and behavioral. For each facility, the following list indicates the percentage of that facility's total resident days in which care is provided for a resident with one of the special needs other than respite care.

Higher percentages of such special needs patients, and higher CMIs, may warrant higher staffing levels. Nevertheless, research described in Appendix B suggests that staffing levels may have an effect on the quality of care provided even to relatively healthier residents. For low-acuity residents, the consequences of understaffing may be less severe, but according to the most comprehensive study, measurable impairment in the quality of care begins when staffing falls below certain numerical levels, no matter what the resident acuity.

Medical need is, of course, only one factor that can influence staffing, and indeed, the data reveals factors that can affect staffing even though they have no apparent relevance to need. For example, in not-for-profit facilities, there is no difference in total staffing levels depending on whether the facility has a majority of Medicaid versus non-Medicaid residents. But in for-profit homes, facilities with more than 50% Medicaid patients provided an average of .54 <u>less</u> total

10

¹⁰ Not-for-profit homes include both private not-for-profits and government owned homes.

nursing hours per resident day than for-profit homes with mostly non-Medicaid residents.¹¹

Some other sources of information

There are many sources of information about nursing homes in New York and issues of staffing. Here are two that you may wish to consult:

http://www.health.state.ny.us/facilities/nursing/ -- "Nursing Homes in New York State" is a website maintained by the New York State Department of Health.

http://www.medicare.gov/ -- "Nursing Home Compare" is a website maintained by the Centers for Medicare and Medicaid Services of the United States Department of Health and Human Services. Go to the home site at the above address, and then choose Search Tools and Compare Nursing Homes in Your Area.

In addition to these governmental websites, there are privately maintained sites, readily accessible on the internet, that you may find helpful.

11

¹¹ This estimate is based on a regression analysis of hours per resident day. In addition to Medicaid reimbursement rate, the analysis controlled for other factors such as facility size, location, private reimbursement levels, CMI and the prevalence of special needs patients.

Some viewpoints on staffing levels and quality of care in nursing homes

New York's residential health care facilities are responsible for the health and well-being of more than 100,000 residents ranging from infants with multiple impairments to young adults suffering from the sequelae of traumatic brain injury to the frail elderly with chronic disabilities. For the vast majority of residents, the residential health care facility is their last home. A license to operate a nursing home carries with it a special obligation to the residents who depend upon the facility to meet every basic human need.

Statement of Purpose in New York's regulation on minimum standards for nursing homes ^a

Poor staffing levels are the single most important contributor to poor quality of nursing home care in the United States. Over the past 25 years, numerous research studies have documented the important relationship between nurse staffing levels, particularly RN staffing, and the outcomes of care. The benefits of higher staffing levels, especially RN staffing, can include lower mortality rates; improved physical functioning; less antibiotic use; fewer pressure ulcers, catheterized residents, and urinary tract infections; lower hospitalization rates; and less weight loss and dehydration.

From a 2004 article by a professor at the University of California^b

^a 10 N.Y.C.R.R. §415.1.

^b Harrington, C., "Saving Lives Through Quality of Care: A Blueprint for Elder Justice," Alzheimer's Care Quarterly 2004; 5(1):24-38

The question of the relationship between the number of staff and quality of care is complex and the Phase I and Phase II studies made good faith efforts at addressing the question. However, the Department has concluded that these studies are insufficient for determining the appropriateness of staffing ratios in a number of respects. Specifically, we have serious reservations about the reliability of staffing data at the nursing home level and with the feasibility of establishing staff ratios to improve quality given the variety of quality measures used and the perpetual shifting of such measures. In addition, the studies do not fully address important related issues such as: the relative importance of other factors, such as management, tenure, and training of staff, in determining nursing home quality; the reality of current nursing shortages; and other operational details such as the difference between new nurses and experienced nurses, staff mix, retention and turnover rates, staff organization, etc. For these reasons and others, it would be improper to conclude that the staffing thresholds described in this Phase II study should be used as staffing standards. Most important, the Phase I and Phase II studies do not provide enough information to address the question posed by Congress regarding the appropriateness of establishing minimum ratios.

|-----|--------------|-------------|--------|
| CI | MS Phase II | Transmittal | Letter |

"It isn't rocket science to say that you need enough staff to help every resident with eating, drinking and infections. It's not like we need to discover the cure for the Nile virus," said Catherine Hawes, a professor and director of Texas A&M University's Southwest Rural Health Research Center and a national authority in evaluating nursing home quality. "We know how this is supposed to be done, but in all too many places it's not."

From a 2002 story in the St. Louis Post-Dispatch^d

^c "Appropriateness of Minimum Nurse Staffing Ratios in Nursing Homes: Phase II Final Report" (2001), http://63.240.208.147/medicaid/reports/rp1201home.asp.

^d Schneider & O'Connor, "Nation's Nursing Homes Are Quietly Killing Thousands," St. Louis Post-Dispatch (Oct. 12, 2002).

[M]y colleagues and I interviewed state survey agency directors, the managers of the state nurse aide registries, residents, family members, ombudsmen, and CNAs working in nursing homes. There was universal agreement that inadequate staffing was the major preventable cause of abuse and neglect. ...

In focus group interviews, CNAs explained why staffing shortages caused or contributed to abuse or neglect. First, the CNAs noted that when they were working short-staffed, there was no way to meet all of the residents' needs. There was strong agreement among the CNAs that the first things to be neglected were range of motion exercises and other types of restorative nursing care, keeping residents hydrated, and giving residents enough time and assistance with eating. Each of these has dire long-term consequences for residents.

The CNAs made it clear that they found such a situation profoundly demoralizing, particularly if it persisted over time. They also noted that this inability to meet resident needs was a major cause of staff turnover among good staff....

Senate testimony in 2002 by the director of the Southwest Rural Health Research Center at Texas A&M^e

Nurse aide work also is dangerous. Back injuries are common from lifting residents, and aides are exposed to infections.

Federal labor statistics show nursing home workers rank fourth in the nation in frequency of injuries and illness, higher even than firefighters.

Aides say they are poorly equipped to keep up with the needs of residents when they're overworked at facilities that can't or won't hire enough staff, or when they're floated from one unit of a facility to another where they don't know the residents.

"You work in places that aren't interested in quality, yet you're given overwhelming responsibilities and asked to do it short-staffed," said Mia Williams, an aide who quit the business in disgust this year to return to school.

From a 2001 story in the Buffalo News^f

^e Hawes, "Elder Abuse in Residential Long-Term Care Facilities," testimony before the U.S. Senate Committee on Finance (June 18, 2002).

List of Staffing Levels

The list of staffing levels contains the following information:

- Column 1: Name and address of nursing home.
- Column 2: **Total nursing staff hours.** Total care is the sum of licensed nursing care plus nurse aide care. Staffing levels in this and the following four columns are expressed in hours per resident day (hprd). This column includes hours spent by nurses on administrative functions as well as on direct (or "hands-on") care.^a
- Column 3: **Total direct care.** This figure includes hands-on care by all nursing caregivers (RNs, LPNs, and CNAs). The figure excludes administrative functions. ^b Breaking out administrative hours allows comparison to the standards that count only direct care.
- Column 4: **RN direct care.** This includes hands-on care by RNs, and excludes hours reported for the survey categories of DON and Nurses with Administrative Duties. °
- Column 5: **LIC direct care.** "LIC" means licensed nursing care. This includes the hands-on care by RNs plus LPNs, and excludes administrative hours.
- Column 6: **CNA care.** This includes the hours reported for Certified Nurse Aides, all of which is hands-on rather than administrative.
- Column 7: **CMS Phase II standard.** The CMS Phase II study identified the following thresholds: 0.75 hprd of RN care, 1.3 hprd of licensed nursing care, and 2.8 hprd of CNA care. The study measured outcomes against

^a Some of the common administrative functions are the preparation of comprehensive resident assessment instruments, quality assurance, infection control, in-service training, and duties of the Director of Nursing and Assistant Director of Nursing. Total hours, including administration, are also included in listings such as the CMS Nursing Home Compare website.

^b Nurses whose principal duties are administrative may sometimes provide hands-on care, but facilities are to report that care on the appropriate line: Form CMS-671, General Instructions and Definitions at 2 ("If an individual provides service in more than one capacity, separate out the hours in each service performed").

Some state standards do count certain hours in the DON and administrative categories, and the explanatory notes describe how we give credit for those hours under those standards.

staffing levels that excluded administrative functions.^d In this and succeeding columns, unless stated otherwise, check marks for a given standard indicate compliance with all the components of that standard.

- Column 8: **Florida standard.** The Florida standard^e requires 1.0 hprd of licensed nursing care plus 2.6 hprd of nurse aide care. It counts only direct care toward licensed nursing hours, including hours of direct care provided by a DON in excess of the required hours for that position, or in a facility with no more than 60 beds.^f
- Column 9: **California standard.** The California standard^g requires 3.2 hprd of total hands-on care (RNs, LPNs, and CNAs). It includes direct care provided by a DON in facilities with fewer than 60 beds.^h
- Column 10: **Vermont standard.** The Vermont standard requires total handson care of 3 hprd, 2 of which must be provided by CNAs. We made the assumption that for purposes of this standard, all DON hours were spent on direct care.
- Column 11: **Ohio RN standard.** We applied only the RN prong of the Ohio standard. That prong requires 0.2 hprd (12 minutes) of hands-on RN care. This includes direct care provided by a DON in facilities with 60 beds or fewer. Because we could not determine whether DON hours were for direct care, we credited those small facilities with all their reported DON hours.

^d "Appropriateness of Minimum Nurse Staffing Ratios in Nursing Homes: Phase II Final Report" at 2-9 (2001). ^e Fla. Stat. §400.23(3)(a). The implementation of standards in Florida and some other states has at times been delayed for budgetary reasons. Ultimately the Florida standards are supposed to reach 2.9 hours of aide care, for total care of at least 3.9 hours, but because that standard has not yet gone into effect, this report uses the existing nurse aide standard of 2.6 hours.

^f We could not determine the extent to which DONs actually provided direct care in such circumstances, and accordingly we credited facilities with all potentially eligible DON hours. In addition, because Florida sometimes allows facilities to apply hours spent by licensed nurses when the nurse performs duties of an aide, we gave the facility credit if its CNA figure was too low but its total nonetheless exceeded 3.6 hours.

^g Cal. Wel. & Inst. Code §14110.7(a).

^h Because we could not identify which DON hours were for direct care, we credited small facilities with all their DON hours.

¹ Vermont Licensing and Operating Rules for Nursing Homes §7.13(d)(1).

^j Ohio O.A.C. Ann. 3701-17-08(C)(1).

^k Ohio also has minimum standards of 2.75 hprd total nursing care and 2.0 hprd nurse aide care, but our data did not enable us to measure compliance with these standards, because Ohio gives credit for some care in ways that OSCAR data does not capture. Thus, again, the facilities are given the benefit of the doubt; some may have check marks that would not have them were each prong of the standard applied.

- Column 12: **Illinois standard.** The Illinois standard requires 2.5 hprd total care, 0.5 of which must be by RNs or LPNs. Illinois does not count DON hours, but we were informed by a representative of the Department of Public Health that hours of all other licensed nurses can be included. We credited each facility with all of its reported hours for nurses with administrative duties.
- Column 13: Special Needs. To assist you in determining the gravity of the needs of a facility's residents, this column shows the percentage of a facility's total resident days accounted for by special-needs patients. The columns for Special Needs and CMI have a dash rather than a zero when we did not have the relevant information for the nursing home in auestion.
- Column 14: **CMI.** Again to assist you in determining the gravity of residents' needs, this column shows the facility's Case Mix Index for the last quarter in which the information was available to us. Case mix is a measure of resident acuity as described at page 9 above.

We include in this calculation pediatric, traumatic brain injury, AIDS, behavioral, and ventilator residents, but exclude respite care.

Categories in which CMS excludes staffing data

- 1. Logical exclusion the facility reports more residents than beds.
 - Exclusions based on staffing reported outside range considered reasonable by CMS.
- 2. Reported total staffing below 1.5 hours per resident day.
- 3. Reported total staffing above 12 hours per resident day.
- 4. Reported CNA staffing above 5.25 hours per resident day.
- 5. Facilities for which more than 50% of beds are noncertified, and reported resident census seems to be based only on certified beds (i.e., reported census is lower than certified beds).
 - Exclusions based on change in staffing values over time.
- 6. The facility is in the top two percentiles in change in staffing level from the previous period.
- 7. Reported total staffing between 6 and 12 hours per resident day, and change in staffing is more than four hours from previous period (unless excluded in that previous period).

Appendix B

Staffing Levels and the Quality of Care: The Research

Many kinds of information are important to people choosing nursing homes. Certainly they may want to know about the quality of care in such facilities. Also relevant is the evidence that links care to staffing. A consumer who learns about this relationship can make more informed decisions about the weight to give staffing levels in choosing a home.

The relationships between staffing levels and quality of care have been studied empirically, with findings from numerous research studies over many years. More recent research has actually identified certain numerical staffing levels below which care is impaired.

In 2001, the Institute of Medicine ("IOM")¹ issued a report reviewing what it called the abundant research evidence that both nursing-to-resident staffing levels and the ratio of professional nurses to other nursing personnel are important predictors of high quality of care in nursing homes.² The 2001 report was not the first assessment by the IOM; it built on prior studies including a 1986 report on ways to improve the quality of care.³ The report noted research associating greater numbers of nurses with improved resident outcomes, and concluded that on the whole there were inadequate numbers of nurses to provide the care needed.⁴

Extensive and thorough academic research has reached similar conclusions. Studies by many researchers over many years have repeatedly described a distinct relationship between nursing staff levels and the quality of care.⁵

¹ The Institute of Medicine is a component of the National Academy of Sciences, which is an independent advisory organization created by the federal government. The IOM's mission is to serve as adviser to the nation to improve health by providing unbiased, evidence-based, and authoritative information and advice concerning health and science policy.

² Institute of Medicine, "Improving the Quality of Long-Term Care" (Wunderlich & Kohler eds. 2001) at 12, 190.

³ Institute of Medicine Committee on Nursing Home Regulations, "Improving the Quality of Care in Nursing Homes" (Takeuchi, Burke & McGeary eds. 1986).

⁴ Id. at 101.

⁵ Many of the studies are briefly described in the 2001 report cited above. IOM, "Improving the Quality of Long-Term Care" (Wunderlich & Kohler eds. 2001) at 187-89. As the IOM report describes, one Massachusetts study found that better outcomes for nursing home residents were not related to higher RN staffing levels, but some seventeen other studies were cited in support of the "positive association between nurse staffing levels and the

Federal agencies have also studied staffing levels. In 1999, the HHS Office of Inspector General (OIG) issued a report based primarily on six studies that it had recently conducted on nursing home care in ten states including New York.⁶ Reviewing extensive evidence of serious care deficiencies – including inadequate prevention and treatment of conditions such as pressure sores, lack of nutrition, and incontinence – the report concluded that nursing home staffing levels should be higher, "since this directly impacts on the care residents receive."⁷

An exhaustive federal study recently provided further support for the relationship between staffing and problems with the quality of care. In 1990, Congress directed HHS to perform a study on nurse staffing levels. The department's Centers for Medicare & Medicaid Services (CMS), with the aid of contractors, consultants, and a panel of technical experts, undertook a massive study, and reported the results in two phases.

The Phase I report, issued in 2000, considered the relationship between staffing ratios and quality of care, based on (i) a review of the literature and expert opinion; (ii) an outcomes analysis using data gathered from approximately 1,800 nursing homes in New York, Ohio, and Texas; and (iii) a time-motion analysis of requirements for implementing five daily nurse aide care processes that have been linked to good outcomes.

The Phase II report was transmitted to Congress in 2002, and included data from a representative sample of over 5,000 facilities in ten states including New York, distinguishing between short-stay and long-stay residents. The report refined the Phase I time-motion analysis,

processes and outcomes of nursing home care." <u>Id.</u> There are also numerous studies in addition to the ones given as examples in the IOM report. For example, when one expert surveyed the academic literature at a briefing for congressional staff members, she cited six additional studies that found a positive relationship between nurse staffing levels and the quality of care. Harrington, "Nursing Home Staffing and Quality", http://nccnhr.newc.com/uploads/CHcongressionalbriefing0502.ppt, slide 12 (2002) (citing 17 studies from 1977 through 2002, in addition to CMS studies, including Fottler et al. 1981, Gustafson et al. 1990, Johnson-Pawlson 1993, Castle 2000, Ryden et al. 2000, and Horn 2002).

⁶ OIG, "Quality of Care in Nursing Homes: An Overview" (1999), http://oig.hhs.gov/oei/reports/oei-02-99-00060.pdf.

⁸ In 1990, Congress directed that HHS complete the study by 1992, but the results were actually not submitted until the following decade.

distinguishing between high, medium, and low workload facilities. It also addressed issues of cost and feasibility of implementing minimum nurse staffing ratios.

The CMS Phase I studies identified strong direct relationships between staffing levels and quality of care. ⁹ In the outcomes study – the largest of its kind ever conducted – researchers used rigorous statistical analysis to determine whether there were relationships between levels of nurse staffing and outcomes such as avoidable hospitalizations, improvement in ability to perform daily activities, and incidence of weight loss and pressure sores.

The analysis showed that quality of care – as measured by the above-described outcomes – suffers seriously when the ratio of staff to patients drops below certain levels. For example, of the facilities that provided an average of at least two hours of daily nurse aide care per resident, only 2% had a high rate of avoidable hospitalizations, and 12% had a significant rate of new pressure sores. Of the facilities that provided an average of less than two hours of daily care by nurse aides, 22% had a high rate of avoidable hospitalizations, and 46% had a high rate of pressure sores. In other words, facilities providing less than two hours of nurse aide care per resident experienced serious problems with pressure sores about four times more often, and with avoidable hospitalizations ten times more often, than better-staffed homes.

The other quantitative component of the Phase I report was the time-motion analysis of daily care processes performed by nurse aides. The analysis simulated care delivery based on clinical research literature showing the importance of certain care processes, the number of residents who needed them, the frequency with which they were needed, and the time required to implement each. The time-motion analysis found that 2.9 hours per resident per day is the minimal nurse aide staffing needed to provide optimal care in an average home.

The CMS Phase II studies, based on more data and more refined analysis, reached similar conclusions. The outcomes study identified staffing thresholds for different types of caregivers,

⁹ HCFA, "Report to Congress: Appropriateness of Minimum Nursing Staff Ratios in Nursing Homes" (2000).

and found that care for long-stay residents was impaired when staffing fell below those numbers. ¹⁰ Here are the thresholds identified in the Phase II study:

| Phase II staffing thresholds below which care is impaired | | | |
|---|------------------------|--|--|
| Staff category | Hours per resident day | | |
| RNs | .75 | | |
| Total licensed nurses (RNs + LPNs) | 1.3 | | |
| Nurse aides (CNAs) | 2.8 | | |

The refined Phase II time-motion analysis reached a result for nurse aides similar to the above result from the outcomes study. ¹¹ The study found that implementation of all the thresholds as minimum requirements "would find 52 percent of all nursing homes failing to meet all of these standards and 97 percent failing to meet one or more." HHS has not sought to base regulations on the findings of these studies, and indeed has questioned whether they fully account for all the

¹⁰ m

¹⁰ The quality measures for long-stay residents were functional improvement, incidence of pressure sores, incidence of skin trauma, improvement in residents' resistance to the provision of needed care, and weight loss. The study concluded that for each quality measure, "there was a pattern of incremental benefits of increased staffing until a threshold was reached at which point there were no further significant benefits with respect to quality when additional staff were utilized." CMS, "Appropriateness of Minimum Nurse Staffing Ratios in Nursing Homes: Phase II Final Report" at 1-6 (2001). The study also found thresholds for short-stay residents, based on quality measures relating to hospital transfers for potentially avoidable causes. Those thresholds were .55 hours for RNs, 1.15 hours for licensed staff, and 2.4 hours for aides. This report compares staffing levels to the thresholds for long-stay patients, but consumers seeking homes for short stays should bear in mind the thresholds found applicable to those circumstances.

¹¹ CMS analyzed the amount of nurse aide staffing minimally necessary to provide all five key care processes on a timely basis in facilities with different case mixes and therefore different workloads. The minimally necessary levels of nurse aide staffing were 2.8 hours per resident day for low workload facilities and 3.2 hours in high workload facilities. CMS, "Appropriateness of Minimum Nurse Staffing Ratios in Nursing Homes: Phase II Final Report" at 1-7 (2001). That analysis has since been validated by further research. A 2004 study, examining sixteen resident care processes typically implemented by nurse aides in areas such as feeding assistance, incontinence care, and exercise, supported the conclusion that nurse aide staffing above 2.8 hours per resident per day is associated with better quality. Schnelle, Simmons, Harrington, Cadogan, Garcia & Bates-Jensen, "Relationship of Nursing Home Staffing to Quality of Care," Health Services Research 39:2 (April 2004).

relevant factors. See footnote 4 on page 5 above. But the Phase II study has been widely cited as the most comprehensive and thorough research on this topic.

The Government Accountability Office provided another recent analysis of the relationship between staffing levels and quality of care. It studied deficiency statistics and staffing data for nursing homes in three states. The overall analysis showed that "nursing hours per resident day – especially nurses' aide hours – were related to quality of care deficiencies, with homes providing more nursing hours being less likely to have identified quality problems than homes providing fewer nursing hours." ¹²

¹² GAO, "Nursing Homes: Quality of Care More Related to Staffing than Spending," GAO-02-431R on Nursing Home Expenditures and Quality (June 2002). The relationship held in Ohio and Washington but there was an inverse relationship in Mississippi. The former states had staffing data available in cost reports, and the study excluded about 5% of their free-standing nursing homes because of missing data; in Mississippi, staffing data was not available in cost reports, and the study excluded 31% of its free-standing nursing homes.

Appendix C

Staffing Levels and the Quality of Care: The Nursing Home Initiative

Since 2001, the Attorney General's Office has pursued a statewide Nursing Home Initiative to examine the responsibility of nursing homes and their owners and executives for conditions leading to poor patient care and abuse. Our investigations have uncovered instances of understaffing that resulted in criminal and other violations. Three cases are described here.

1. Chandler Care Center

Chandler Care Center, an Ossining nursing home, deteriorated from a fully staffed and generally well-run home to a facility that endangered its residents because of its owner's relentless efforts to cut costs. The administrators and medical director of the facility repeatedly brought the facility's acute staffing problems to the owner's attention, but he routinely rebuffed them and refused to take action.

Surveyors from the Department of Health found the facility unbearably hot during their summer inspection because most of the rooms were not air-conditioned. Nevertheless, Chandler staff did not take even minimal steps such as making water available to all residents and closing blinds. Despite a long-term infestation by black flies, staff did not take the steps necessary to protect residents.

Because it billed the Medicaid program for grossly insufficient services, Chandler Care Center was convicted of stealing about \$400,000 in Medicaid reimbursement. The individual owner, Samuel Klein, was convicted of wilful violation of the Public Health Law for failing to employ sufficient nurses to assure that each resident received appropriate care.

2. Hallmark Nursing Centre

An investigation of Hallmark Nursing Centre, a Schenectady nursing home, likewise resulted in a criminal conviction of the home. The investigation was sparked, in part, by the facility's failure to correct repeated deficiency citations by the state Department of Health.

Inspectors had cited the facility for insufficient staffing once in 2000 and twice in 2001. In the first of those surveys, the inspectors found that twelve residents who had not received adequate care had suffered harm, including reduced ambulation and range of motion, and increased rates of pressure sores. In the second survey, inspectors found that insufficient staff levels had compromised proper care as to pressure sores, resulted in medication errors, and undermined patient dignity. In the third, there were again findings of deficiencies in the areas of pressure sores and administration of medications.

The administrator of the nursing home knew as early as April 2000 that staffing was at a critically low level and that resident care was at risk. Although Hallmark assured the Health Department that it would address staffing issues at the facility, the facility continued to cut staffing until it reached its lowest levels in January and February 2001. Yet at the same time that staff levels dropped, the facility continued aggressively to pursue new patient admissions to increase revenues. The failure to employ additional staff was not due to a lack of financial resources; in 2000, the owners withdrew more than a million dollars from the facility.

The owners' enhanced profits came at the cost of care necessary to the well-being of the residents. As the Department of Health found, during the period that staffing was slashed, multiple residents developed unnecessary pressure sores and went without needed treatments, therapies and medications.

At Hallmark, the worst shortages were of RNs. Because RNs were not available to perform the assessments that only they are authorized to do, many residents did not get proper medical interventions. Hallmark sustained a drastic decline of RN staffing around the year 2000, falling from a high of almost 35 minutes of RN care per resident day to a low of about 4 minutes per day in 2001. In addition, to cover up the fact that assessments had been performed by unauthorized staff rather than by registered nurses, nursing home staff falsified the facility's records.

In June 2003, Hallmark Nursing Centre pled guilty to having criminally violated the Public Health Law by operating the nursing home without sufficient nursing staff. The home also pled guilty to the felony of falsifying business records. Hallmark paid back one million dollars to the Medicaid program, and its owners were permanently barred from the nursing home industry.

3. The Waters

The Waters of Aurora Park and the Waters of Orchard Park, two Erie County nursing homes, operated in such a substandard way that they were forced to agree to an independent monitorship.

Some of the neglect of the residents of these homes was documented in multiple inspections by the Department of Health. It cited the nursing homes for numerous deficiencies including ones that had resulted in harm to residents. The deficiencies included the facility's failure to prevent and treat pressure sore wounds; failure to give patients medications on a timely basis; failure to provide necessary treatments and evaluations; and failure to provide appropriate toilet assistance for some residents. The Department also found that in 1999 and 2000, the facilities did not have nursing staff sufficient to provide required care.

In October 2003, the homes entered into an agreement which included the appointment of an independent monitor and the repayment to the Medicaid program of three million dollars.

Appendix D

Staffing Data and Its Sources

There are various sources of staffing data for facilities in New York State. As noted above, the staffing information in the foregoing list is drawn from a CMS database called Online Survey, Certification, and Reporting (OSCAR). State surveyors – in New York, employees of the Department of Health – inspect each nursing home at least once during a 15-month period. Each time there is an inspection, the facility is required to report certain information, including staffing levels, to CMS.

Consumers should be aware of other sources of staffing information as well. For example, it can be useful to speak with people familiar with the staffing patterns at a particular nursing home. Moreover, starting in 2003, nursing homes have been required to post the number of licensed and unlicensed nursing staff directly responsible for resident care on each daily shift.¹ This requirement has been elaborated in a regulation, effective December 27, 2005, requiring daily posting of the total number and the actual hours worked by RNs, LPNs, and CNAs, as well as the resident census. The posting must be in a clear and readable format in a prominent place readily accessible to residents and visitors. Also, the facility must, upon oral or written request, make nurse staffing data available to the public for review at a cost not to exceed the community standard. ²

Staffing information is also found in yearly cost reports that nursing homes are required to file with the Department of Health. These reports provide staffing data for an entire year and they are reviewed by outside auditors. One drawback to this source is that the most recent available cost report figures are for calendar year 2004, so the OSCAR figures are more current overall.

 $^{^1}$ Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000, sec. 941. 2 70 Fed. Reg. 62065 (Oct. 28, 2005).

There is, moreover, a gap in the cost report data. For nursing staff actually employed by the facility, the cost reports provide specific information about hours of direct care, as well as numbers of residents, allowing ready computation of care hours per resident day. For many homes, however, the hours listed in the cost reports are an incomplete measure of the care given, because those homes supplement their staff by contracting with outside employment agencies who supply "agency" staff as needed. As to such "agency" nursing staff, the cost reports list the dollar amounts that the facilities spent on these labor costs, but they do not specify staffing levels by hours. The omission of agency hours led us to choose the OSCAR data over the cost report data for inclusion in this report.

Nevertheless, the cost report data has certain advantages. The OSCAR figures reflect only a two-week period at the time of the survey, and they are gathered and reported, without audit, by the facilities themselves. In our nursing home investigations we have seen instances of institutions increasing staffing during the two-week reporting period. The use of OSCAR data – as in this report, and in the federal government's Nursing Home Compare website – may in some cases be a generous approach to measuring the staffing of a nursing home.

Attempts to quantify the reliability of OSCAR data have yielded conflicting results. One study found average staffing hours reported on OSCAR for California facilities to be only .1 hour higher than corresponding cost report data.³ On the other hand, some recent OIG reports "have found that actual staffing levels are often significantly lower than the self-reported [OSCAR] staffing data contained on the Nursing Home Compare website, in one instance by 36%."⁴

We compared the OSCAR data to cost report data for facilities in New York. Average staffing levels were close between the two sources for each kind of caregiver. This observation provided further support for the utility of the OSCAR data. However, there are particular

⁴ Letter from Rep. Waxman and Sen. Grassley to Hon. Tommy Thompson, at 2 & n.6 (June 25, 2004).

instances in which a nursing home's staffing, as reflected in the presumptively more reliable cost report, is significantly less than the levels reflected in OSCAR. When the OSCAR staffing levels for a nursing home seem out of line with other information, consumers may want to inquire into the extent and significance of any apparent discrepancies.
